

PENTICTON ELECTRIC LTD

Solar Panel / Grid-Tie Systems

Ad#07

Reg#94215

Fortis's Net Metering program is designed for residential and commercial customers who wish to generate their own electricity using a "BC Clean" energy source such as solar, wind or micro hydro, and connect to the Fortis distribution system.

When customers with their own generation capabilities produce more than they consume, they will receive a credit from Fortis that goes to their account and can be applied against future consumption charges or be paid out annually.

Grid Intertie Direct (without batteries).

These systems are the simplest, and the most cost effective in terms of \$ per kW of electricity to produced. They work just like any other appliance in your home - with the notable exception is they create electricity and push it backwards into the power grid. These systems are extremely scalable and flexible. Starting points around \$10,000 and the sky is the limit from there.

Grid Intertie / Backup Systems (with batteries).

These systems add storage in terms of batteries. This gives you more flexibility, in terms of having a reserve energy system that will operate when the grid goes down. It also allows flexibility in terms of buying and selling power at different times of the day (to take advantage of time of use electricity metering).
